

BREAKING: CDC Study Finds COVID Shots Increase the Risk of a Leading Cause of Maternal and Fetal Death by 24%

Hypertensive disorders of pregnancy are major drivers of preterm birth, emergency delivery, seizures, stroke, organ injury, long-term cardiovascular disease, and maternal fetal death.

A [newly published CDC registry study](#) using data from the CDC's COVID-19 Vaccination Pregnancy Registry (C19VPR) and the Pregnancy Risk Assessment Monitoring System (PRAMS) compared approximately 8,000 vaccinated pregnant women to 8,000 unvaccinated pregnant women and found a **24% higher relative risk of hypertensive disorders of pregnancy (15% vs. 12%) among those who received COVID-19 shots**. These disorders — which include gestational hypertension and preeclampsia — are a leading cause of maternal and fetal death worldwide. The association was statistically significant, persisted in sensitivity analyses, and remained after adjustment for multiple confounders.

The absolute difference observed was 3 percentage points. That means roughly 1 additional case of hypertensive pregnancy complications for every 33 vaccinated pregnancies. If even 40–60 million pregnant women worldwide received COVID vaccination during the global rollout period, a 3% absolute increase would translate into an estimated 1.2 to 1.8 million additional cases of hypertensive pregnancy complications globally.

Hypertensive disorders **are not** benign. They increase the risk of preterm birth, NICU admission, emergency induction, C-section, long-term maternal cardiovascular disease, and in severe cases, maternal and fetal death. Even in well-resourced settings these conditions significantly alter pregnancy outcomes.

Consequences of Hypertension in Women

Stroke

- IHC
- Genetics
- HIV, TB, malaria

Heart Failure

- Infectious diseases
- Rheumatic

Chronic Kidney Disease

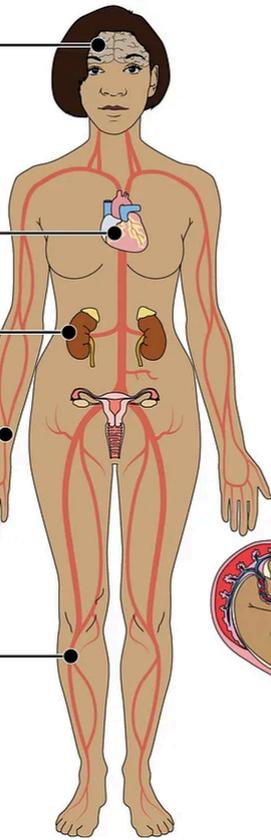

- HIV-related
- APOL1 gene
- Hemorrhage, sepsis

Arterial Dysfunction

- Infectious diseases
- Arterial stiffness

Peripheral Arterial Disease

- Younger age group
- Difficult to detect

Consequences of Hypertension in Pregnancy

Impacts 1 out of 10 pregnancies

- Gestation hypertension
- Preeclampsia
- Eclampsia

Maternal short-term consequences:

- Post-partum hemorrhage and seizure

Maternal long-term consequences:

- Neurological issues, liver issues, CKD, CVD, LVH, HF, PAD, stroke, and organ failure

Other pregnancy consequences:

- Obstetric hemorrhage (anemia)
- Seizures
- Infections
- Peripartum cardiomyopathy

Baby short-term consequences:

- Premature, stillbirth, IUGR, placental abruption, LBW, low nephron mass, fetal demise

Baby long-term consequences:

- Metabolic disorders, improper growth and development, CVD, neurological disorders

The study also found that COVID-19 illness during pregnancy carried a similar magnitude of risk (adjusted RR 1.28). It is not known what the risk would be if a mother were both infected and vaccinated — but it is likely higher than either exposure alone.

Pregnant women were told these genetic products were safe. And now, the CDC has identified a statistically significant elevation in one of the most serious obstetric complications.

Global accountability for the harm inflicted on mothers and their unborn children warranted.

Dr.Sansone has created for each state a bill outlawing all mRNA products; each bill is based on state's laws. You can find the bill for your state at his Substack Mind Matters and send to any Freedom lobbying group in your state and to state legislators. I sent to Texans for Medical Freedom and to Texans for Vaccine Choice .
